

Sampling

	What it is	Advantages	Disadvantages
Census	A collection of data from an entire population	Gives a completely accurate result	<ul style="list-style-type: none"> • Time consuming+Expensive • Can not be used when testing involves destruction • Large volume of data to process
Sample survey	A survey of a small sample of the population	<ul style="list-style-type: none"> • Cheaper • Quicker • Easier to process 	<ul style="list-style-type: none"> • Data may not be accurate • Data may not be large enough to represent small sub groups
Random Sampling	Each thing has an equal chance of being selected	<ul style="list-style-type: none"> • Numbers truly random and free from bias • Easy to use • Each number has a known equal chance of being selected 	<ul style="list-style-type: none"> • Not suitable when population is large
Lottery sampling	Each element of a population put on a ticket. Tickets drawn randomly from container(without displacement)	<ul style="list-style-type: none"> • Tickets are drawn at random • It is easy to use • Each ticket has a known chance of selection 	<ul style="list-style-type: none"> • It is not suitable when the population is large • A sampling frame is needed
Systematic sampling	Required elements are chosen at regular intervals in an ordered list	<ul style="list-style-type: none"> • Simple to use • Suitable for large samples 	<ul style="list-style-type: none"> • Only random if ordered list is truly random • Can introduce bias
Stratified sampling	Population is divided into groups and a simple random sample is carried out in each group	<ul style="list-style-type: none"> • It can give more accurate estimates than simple random sampling where clear strata are present • Reflects the population structure 	<ul style="list-style-type: none"> • Within the strata, the problems are than same as for any simple random sample • If the strata are not clearly defined they may overlap
Quota sampling	The population is divided into groups by gender etc. A quota of people in each group is set to try and reflect the group's proportion in the whole population	<ul style="list-style-type: none"> • Enables fieldwork to be done quickly because a small sample size is taken. • Costs kept to a minimum • Administering test is easy 	<ul style="list-style-type: none"> • Not possible to estimate the sampling errors • Interviewers may not be able to judge characteristics easily • Non responses are not recorded • Can introduce interview bias

Types of data

Type of data	Advantages	Disadvantages
Primary	<ul style="list-style-type: none">• The collection method is known• The accuracy is known• The exact data needed is collected	<ul style="list-style-type: none">• It is costly in time and effort
Secondary	<ul style="list-style-type: none">• They are cheap to obtain• A large quantity of data is available• Much of the data has been collected for years and can be used to plot trends	<ul style="list-style-type: none">• Bias is not always recognised• It can be in a form that is difficult to deal with
