# Continuous Random Variables

## 1 Probability density function (PDF)

The PDF describes how the probabilities are distributed over the range of values. f(x) must satisfy these basic properties:

- $f(x) \ge 0$  for all values of x, so that no probabilities are negative.
- $\int_{-\infty}^{-\infty} f(x)dx = 1$  (The sum of all probabilities is 1)

• 
$$P(a < x < b) = \int_a^b f(x) dx$$

For continuous random variables  $P(x < z) = P(x \le z)$ 

$$f(x) = \begin{cases} \frac{1}{2}(x-3), & \text{for } 3 \le x \le 5\\ 0, & \text{otherwise} \end{cases}$$

$$\int_{3}^{5} \frac{1}{2}x - \frac{3}{2} dx = \left[\frac{x^{2}}{4} - \frac{3x}{2}\right]_{3}^{5} = \left(\frac{5^{2}}{4} - \frac{3 \times 5}{2}\right) - \left(\frac{3^{2}}{4} - \frac{3 \times 3}{2}\right) = 1$$

$$Find \ P(x < 4)$$

$$\int_{3}^{4} \frac{1}{2}x - \frac{3}{2} dx = \left[\frac{x^{2}}{4} - \frac{3x}{2}\right]_{3}^{4} = 0.25$$

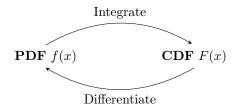

$$f(x) = \begin{cases} x, & \text{for } 0 \le x \le 1\\ 2 - x, & \text{for } 1 \le x \le 2\\ 0, & \text{otherwise} \end{cases}$$

$$P(0.5 < x < 1.3) = \int_{0.5}^{1} x \, dx + \int_{1}^{1.3} 2 - x \, dx = \left[\frac{1}{2}x^{2}\right]_{0.5}^{1} + \left[2x - \frac{1}{2}x^{2}\right]_{0.5}^{1} = 0.63$$

### 2 Cumulative Distribution Function

The CDF is  $P(X \leq x)$ 

To find it, integrate the **PDF** between the lower limit and x.

$$f(x) = \begin{cases} \frac{1}{2}(x-3), & \text{for } 3 \leqslant x \leqslant 5\\ 0, & \text{otherwise} \end{cases}$$

$$\int_{3}^{x_{0}} \frac{1}{2}x - \frac{3}{2} dx = \left[\frac{x^{2}}{4} - \frac{3x}{2}\right]_{0.5}^{1} = \left(\frac{x^{2}}{4} - \frac{3x}{2}\right) - \left(\frac{3^{2}}{4} - \frac{3 \times 3}{2}\right) = \frac{x^{2}}{4} - \frac{3x}{2} + \frac{9}{4}$$

$$F(x) = \begin{cases} 0, & \text{for } x < 3\\ \frac{x^{2}}{4} - \frac{3x}{2} + \frac{9}{4}, & \text{for } 3 \leqslant x \leqslant 5\\ 1, & \text{for } x > 5 \end{cases}$$

#### Example 2

Example 2
$$f(x) = \begin{cases} x, & \text{for } 0 \le x \le 1\\ 2 - x, & \text{for } 1 \le x \le 2\\ 0, & \text{otherwise} \end{cases}$$
Find the CDF

$$\int_0^x x \, dx = \left[\frac{x^2}{2}\right]_0^x = \frac{x^2}{2}$$

$$F(1) + \int_1^x 2 - x \, dx = \frac{1^2}{2} + \left[2x - \frac{x^2}{2}\right]_1^x = \frac{1}{2} + \left((2x - \frac{x^2}{2}) - (2 - \frac{1}{2})\right) = 2x - \frac{x^2}{2} - 1$$

$$f(x) = \begin{cases} 0, & \text{for } x < 0 \\ \frac{x^2}{2}, & \text{for } 0 \leqslant x \leqslant 1 \\ 2x - \frac{x^2}{2} - 1, & \text{for } 1 \leqslant x \leqslant 2 \\ 1, & \text{for } x > 2 \end{cases}$$

#### Mean and variance of continuous random variables

Mean= 
$$\mu = E(x) = \int_a^b x f(x) \ dx$$
 for  $a \le x \le b$   
 $\operatorname{Var}(x) = E(x^2) - (E(x))^2$   
 $E(x^2) = \int_a^b x^2 f(x) \ dx$
